PYTHON NOTES — DAY 09

Break and Continue Statements | Based on pages 111–112

1. break Statement

Meaning: The **break** statement stops the loop immediately when the specified condition becomes True. The program then continues with the statement after the loop.

Example

```
for i in range(1, 8):
    if i == 4:
        break
    print(i)
```

Output

```
1
2
3
```

Explanation: When i becomes 4, break ends the loop. Therefore, 4, 5, 6 and 7 are not printed.

2. continue Statement

Meaning: The **continue** statement skips the remaining statements in the current iteration and moves to the next iteration of the loop. It does not end the whole loop.

Example

```
for i in range(1, 6):
    if i == 3:
        continue
    print(i)
```

Output

```
1
2
4
5
```

Explanation: When i becomes 3, continue skips that iteration's print(i) statement. The loop then continues with 4 and 5.

3. Difference Between break and continue

break	continue
Stops the entire loop.	Skips only the current iteration.
Control moves to the statement after the loop.	Control moves to the next iteration.
Useful when the loop should end after a condition is met.	Useful when particular iterations should be skipped.

4. Quick Revision

• **break** = exit the loop immediately.
• **continue** = skip the current iteration and continue with the next one.

- Both statements are commonly used with for and while loops.
- Indentation matters: place each statement inside the loop at the correct level.
